Masha BC Sessions

Tentixo bookkeeping operations —
session notes and workflow reference

VERSION	1.2
UPDATED	June 2026
CLASSIFICATION	Internal
AUTHOR	Tentixo AB

Masha handles all Tentixo bookkeeping. These sessions document her actual workflow. Some patterns are small-company shortcuts (manual where automation would be appropriate at scale). Flag these when extracting to client-facing material.

Session 1 — June 4, 2026 (1h 15m)

Topic: Full monthly bookkeeping cycle — receipts, salaries, tax, fixed assets, invoicing, payment reconciliation

1. Monthly workflow overview

Masha's monthly cycle, roughly in order:

1. **General ledger entries** — receipts and bank costs
2. **Salary bookkeeping** — from Nmbros (external payroll system) via journal templates
3. **Skatteverket entries** — distribute tax payments to specific accounts
4. **Fixed asset maintenance** — new acquisitions, depreciation runs
5. **Sales invoices** — create and send to customers
6. **Purchase invoices** — manual or via Tungsten Automation (scanning)
7. **Payment reconciliation** — match bank XML to open entries, apply payments

Source of truth: The bank statement. Every entry must have a matching receipt or invoice. Receipts must be kept 10 years (electronic OK if received electronically; physical receipts still need paper).

2. General ledger entries — receipts

Masha posts receipts one-by-one from the bank statement into General Journal entries:

- **Balancing account:** Always the bank account (Danske Bank)
- **Posting groups:** Purchase / Domestic / then VAT rate depends on expense type. The "all five or none" rule (§4.3 of playbook) applies. **Exception:** bank-to-bank transactions (e.g., Danske → Employee, Danske → Skatteverket, loans to/from companies) — these have no posting groups since no purchase/sale is involved.
- **Total amount:** Bank statement is the source of truth, especially important for receipts in non-SEK currencies where the amount may differ from the receipt face value.
- **Document number:** Auto-assigned. Masha stamps the physical receipt with the document number for traceability.
- **Date:** Bank statement date is source of truth (may differ from receipt date)

- **Document type:** Left blank for receipts (only used for invoices/payments/credit memos)

Journal batch setup: Masha has pre-configured journal batches with different default balancing account types: - "Danske" batch → default balancing = Bank Account (for receipts) - "Default" batch → default balancing = G/L Account (for salary distribution etc.)

Recurring foreign-currency expenses (GitHub, Docker, Google Workspace, Cloudflare): These are receipts, not invoices. They come in USD/EUR, so the SEK amount varies monthly due to exchange rates. Can't easily template these.

Cheat sheet: Masha maintains a personal quick-reference of frequently used account numbers and the monthly process steps.

3. Swedish VAT rates in practice

RATE	VAT PROD. POSTING GROUP	APPLIES TO
25%	SERVICE (standard)	Most goods and services in Sweden
12%	SERVICE MEDIUM	Hotels in Sweden, restaurant food in Sweden
6%	SERVICE LOW	Transport (cabs, flights) domestic Sweden
0%	SERVICE ZERO	Foreign services (Uber abroad, hotel abroad, international flights), insurance, health/gym, banking costs

Key rules: - Cabs/hotels: VAT rate tied to **location of use**, not location of purchase. Spanish hotel = 0%, Swedish hotel = 12%. - International flights (SE → abroad) = 0%. Domestic flights within SE = 6%. - Tips (e.g., Uber) = 0% VAT even if the ride itself has 6%. - Business dinners: max 300 SEK/person deductible. Alcohol is always non-deductible. Food-only portion gets 12% VAT.

4. Multi-line postings (split VAT)

When a single bank transaction contains items at different VAT rates, Masha splits it across multiple journal lines under the **same document number**:

Example — Uber with tip (227 SEK total):

Line 1: 5890 (cab expense)	200 SEK	Service Low (6%)	"Uber trip"
Line 2: 5890 (cab expense)	27 SEK	Service Zero (0%)	"Uber tip"
Line 3: Bank account	-227 SEK	(no posting groups)	balancing

Total balance = 0. One document number, three lines.

Business dinner calculator: Tentixo has a spreadsheet that splits restaurant receipts into deductible food (up to 300 SEK/person, 12% VAT) and non-deductible portions (alcohol, excess). Output feeds the multi-line posting.

5. Employee reimbursements

When an employee pays a company expense from a personal card:

- Post the expense as a G/L entry, but use **Employee account** (not bank) as balancing account
- This creates an open entry on the employee ledger showing the company owes them
- When salary is paid, the reimbursement nets against the salary advance
- Employee ledger shows open entries that need to be "glued together" (applied) to close them

6. Salary bookkeeping

External system: Nmbrs (Visma-owned payroll system, separate from BC). Produces two outputs: 1. Per-employee salary specification (breakdown of gross, tax, net) 2. Consolidated monthly summary with account numbers and amounts

BC process: - Use a **saved journal template** ("Standard Journals") pre-populated with the recurring salary accounts - Verify and adjust amounts month-to-month (amounts vary due to benefits, car allowance, etc.) - Salary accounts are split per employee group: 7211 (salary to shareholders), 7221 (salary to staff) — likewise for employer contributions (7511, 7512) - Post as a single G/L batch where balancing account = bank. Total must net to zero.

No integration between Nmbrs and BC — Morre has confirmed this. Manual transfer via saved journal templates is the only path.

7. Skatteverket (tax authority) entries

Tax payments flow from the bank to a **tax account** (Skattekonto), then get distributed to specific accounts:

- The bank statement shows one lump payment to Skatteverket
- Masha posts: Bank → Tax account (one line)
- Then distributes from Tax account to individual accounts (preliminary tax, social contributions, etc.) using the Skatteverket statement as source
- Accounts used: 2518, 2650, 2710, 2730, 8423, etc.
- No posting groups needed on tax distribution lines (already within the tax system)

Masha keeps a cheat sheet of account numbers since they're roughly the same each month.

8. Fixed assets

Two categories (Swedish standard):

CATEGORY	THRESHOLD	DEPRECIATION	BC TREATMENT
LVA (low-value asset)	2,000–20,000 SEK	Written off immediately (start date = end date)	Acquisition cost only, book value → 0

CATEGORY	THRESHOLD	DEPRECIATION	BC TREATMENT
Main fixed asset	> 20,000 SEK	Over N years (e.g., 3 years for laptops)	Monthly depreciation calculation

Process for new asset: 1. Create Fixed Asset card (number, description, FA class: tangible LVA or tangible main) 2. Post acquisition cost via **Fixed Asset Journal** (amount ex-VAT, since VAT already handled in receipt posting) 3. For main assets: set depreciation period on the card 4. Monthly: run **Calculate Depreciation** (Actions → Tasks → Calculate Depreciation) — creates journal lines moving value from FA account to depreciation expense account

For LVA: Acquisition cost posts and book value immediately goes to zero (depreciation start = end date).

Disposal: When an asset is retired, post disposal in FA journal. Then manually set status to Inactive and Blocked on the FA card (this is not automated by the disposal posting).

Serial numbers: Should be recorded on FA cards for audit trail, though not required for reporting.

9. Sales invoices

- Created from the Customer card → New Document → Sales Invoice
- Lines can be: Resources (people), Items (licenses), or G/L Accounts (*Masha's note: she can't recall ever using G/L Accounts on sales invoices — technically possible but unverified if reasonable. Check with Morre.*)
- Sent directly from BC as PDF email attachment (email integration configured)
- Credit memos for corrections
- Tentixo skips Quotes and Orders — goes straight to Sales Invoice (small company, simple sales cycle)

10. Purchase invoices

Two methods:

1. **Manual:** Vendor card → New Document → Purchase Invoice → manually enter lines. Rarely used at Tentixo itself, but Masha uses this method for all other companies she handles (Swaxy, Idonex, etc.).
2. **Tungsten Automation** (formerly AP Essentials): Invoice scanning tool integrated with BC.
3. Upload PDF invoices → system reads/OCRs the data
4. Verify extracted data (amounts, dates, vendor)
5. Click OK → appears in BC's Incoming Documents
6. From Incoming Documents → Create Document → auto-creates Purchase Invoice linked to correct vendor
7. Still requires manual validation before posting (*Masha's note: the verify step in Tungsten may be skippable — could validate only in BC's Incoming Documents instead. Workflow improvement to confirm.*)

New suppliers need vendor card setup before scanning works.

Note from Morre: BC now has **native invoice-scanning** support (new function, not yet configured at Tentixo). May supersede Tungsten Automation.

11. Payment reconciliation

Semi-automated via bank XML import:

1. Download XML transaction file from Danske Bank (monthly)
2. In BC: Payment Reconciliation Journal → Import Bank Transactions → upload XML
3. BC auto-matches transactions to open invoices
4. Masha removes receipt lines (those were already posted as G/L entries)
5. Validates remaining matches — checks that BC picked the right invoice (especially for same-amount, different-month cases)
6. Posts the reconciliation

Manual payment application (when needed): - Sales Journals → Payment document type → select Customer → Apply Entries → select open invoice → post - Purchase Journals → same flow for vendor payments - Can also apply after the fact: go to Customer/Vendor ledger → Apply Entries

Foreign currency exchange rate differences (invoices only)

When paying invoices in foreign currency (EUR, USD), the exchange rate at posting may differ from the rate at payment.

Two accounts: - Exchange gains: **3960** - Exchange losses: **7960**

The asymmetry bug: When Tentixo *overpays* (exchange rate moved against them), BC offers "Transfer Difference to Account" — one-click resolution. When Tentixo *underpays* (exchange rate moved in their favor / they made money), this option is **not available**. Masha must manually create a journal entry to record the gain. She considers this a BC bug.

Workaround for exchange gains: Create a manual G/L journal entry: Vendor + payment amount → balancing account = exchange gain account (3960). **Important:** Remove the currency on the journal line so the correction is posted in SEK.

12. Tools and integrations

TOOL	PURPOSE	INTEGRATION WITH BC
Danske Bank	Banking	XML export for payment reconciliation
Nmbrs (Visma)	Payroll calculation	Manual (no integration)
Tungsten Automation (AP Essentials)	Invoice scanning/OCR	Integrated — creates Incoming Documents

TOOL	PURPOSE	INTEGRATION WITH BC
Email	Invoice delivery	Integrated — send PDF directly from BC
Business dinner calculator	Entertainment expense compliance	Spreadsheet (no integration)

Observations and flags

Small-company shortcuts (not recommended for clients): - Manual receipt posting one-by-one from bank statement - Manual salary transfer from Nmbrs to BC via templates (no integration) - Manual purchase invoice creation for other companies (rarely needed at Tentixo itself)

Context-dependent (may or may not be shortcuts): - Physical receipt stamping for document number tracing — *(Masha's note: there's a legal requirement for paper trail when digital storage isn't possible, so this may be necessary rather than a shortcut)* - Skipping Quotes and Orders in the sales flow — *(depends on each client's sales process)* - Bank reconciliation frequency — *(XML files are monthly, so reconciliation is effectively monthly, not quarterly as originally noted)*

Genuine best practices (transferable to clients): - Bank statement as source of truth - Journal batch presets per workflow (Danske vs Default) — tax account can also be added as a preset - Saved journal templates for recurring salary postings - XML bank import for payment reconciliation - Tungsten Automation for purchase invoice scanning (note: BC native scanning may supersede this) - Split-VAT multi-line posting technique - Fixed asset LVA vs main classification with correct depreciation handling

Open questions for Morre: - ~~Is there a Nmbrs ↔ BC integration that Masha hasn't explored?~~

Confirmed: no integration exists. (Morre explored this.) - The exchange rate gain/loss asymmetry — is this a known BC limitation or a configuration issue? - Could receipt posting be automated via the same XML bank import used for payment reconciliation? - Employee ledger vs. salary posting — is Masha's approach standard or is there a cleaner pattern? - Can G/L Accounts reasonably be used on Sales invoice lines? (Masha unsure — §9) - BC native invoice scanning — should Tentixo configure this to replace Tungsten? (Morre flagged)

Restructuring suggestions from Masha (applied in v1.2): - ~~§12 (Foreign currency) should move under §11 (Payment reconciliation)~~ **Done** — merged as subsection of §11 - ~~Recurring FX expenses note (GitHub, Docker etc.) should move to the receipts section~~ **Done** — moved to §2

Version History

VERSION	DATE	CHANGES
1.0	2026-06-05	Session 1 documented

VERSION	DATE	CHANGES
1.1	2026-06-08	Masha's review feedback applied: posting group exception for bank-to-bank, FX accounts (3960/7960), purchase invoice scope corrected, SEK warning on FX workaround. Open comments flagged.
1.2	2026-06-08	Restructured per Masha: FX exchange merged into §11 (payment reconciliation), recurring FX expenses moved to §2 (receipts). Old §12→§13 renumbered to §12.
